

PREVIDIA-MICRO-MSR

Previdia Micro control panels

Conventional control panel for fire detection, gas and extinguishing systems

Previdia Micro fire control panels offer a revolutionary approach to conventional fire and gas detection systems.

Previdia Micro combines the advanced features of the Previdia series, while maintaining the simplicity and convenience of conventional solutions. These panels can be enhanced with additional cards and have the ability to connect to the HORNET+ network with other analog addressable panels from the same range. This feature also allows system management through the Inim Fire app, which provides video verification services and notifications.

The Previdia Micro panels manage:

- 4 detection zones (fire or gas with relay or 4-20mA)
- 4 T function terminals (fire detection, gas, function input or low power output)
- 3 I/O terminals (fire detection, input or high power output).
